

# Java Educator Install on a PC

(Revision Date: 03/07/03)

## **Overview**

This document contains instructions for installing Skyward Java Educator Access on a Windows PC.

## **Audience**

End users who need to access Skyward Java Educator Access from a PC

## **Java Educator Install**

Open an Internet Explorer browser window and enter your district's Java Educator Access URL. These will vary for each school district. Your district's URL will be in the form <http://educator.<districtname>.wa-k12.net>. Contact your local administrator or ASP Coordinator for your URL.

Once you are at the correct web page for your district, the Java Educator client will automatically download.

When the download has completed, close and restart your browser and log in to Java Educator Access.

The download should happen fairly quickly for it to be a good download. If you experience a large amount of network latency the application may not load correctly. You will have to force a reinstall when more network bandwidth is available.

To force an installation, navigate to <http://bookmark.<districtname>.wa-k12.net> and select the Educator Access Installation link.
